

# 3D DOOR PROTECTOR WITH ANNUNCIATOR

## Improves passenger safety in elevator doors

The 3D door protection with optional voice annunciator adds another layer of passenger safety. It's ideal for buildings such as retirement homes, hospitals and public access buildings.

The solution uses red and green indicators that turn on and off when the doors are opening and closing.

The 3D protection is achieved using a sensor within the transom. The beam is projected out to an area of 7½" (200 mm) deep by 35½" (900 mm) wide.

An optional voice annunciator can be added to provide audio cues for additional safety.

For additional passenger protection, there's a 3D option with two independent detection systems.

The first system uses direct infrared beams. The second system operates between the hoistway doors and into the hallway. It reduces passenger injury risks from hallway doors.

### Features and benefits

- Easy installation
- Customer selects a message, which is pre-recorded at the factory
- Volume controlled on-site
- Complies with ADA requirements
- Complies with ASME A17.1 Appendix E
