

ELECTRONIC DOOR EDGE

Reduces passenger injury risk in elevator doors

Infrared door safety systems send invisible light beams that cover your elevator doorway. When one of these light beams is broken, the door reopens without contacting a person's body.

These replace older mechanical systems that reopened the door after it contacted a person's body or an object. With the new systems, there's reduced risk of passengers being injured by elevator doors.

You can also install a device that provides visual and noise notifications when the doors open and close.

Features and benefits

- Improves passenger safety
- Increases elevator reliability
- Reduces door-related failures
- Prevents premature closing of doors
- Helps reduce damage and liability
- Complies with ASME A17.1 Appendix E
