

ROLLER GUIDES

Improves elevator ride quality

Elevator ride quality is critical. If your elevator bumps, rumbles or vibrates, passengers may gain a negative impression of your building or its management. Frequently, the only solution for vibration or noise is roller guide replacement. Our roller guides will give your elevator a smoother and quieter ride.

The roller guides maintain consistent, unified pressure and absorb vibration and excessive movement from alignment issues. With quick installation and easy adjustments, our roller guides will improve ride quality to a level expected by today's passenger standards.
